Technical Test

Follow the following steps to run the project:

- Install node.js
- Install the required dependencies, npm install express and body-parser
- Run with npm run.
- To access the poll, go to http://localhost:3000/voting.html
- To access the confirmation page go to, http://localhost:3000/confirmation.html

Unit testing could be carried out on the front and the back-end to ensure that it is all working correctly. The API could be tested through Api management software such as Insomnia to ensure all the requests are working correctly. My choice for node.js was based on the fact that I have had an interest in learning node.js but have not had any formal experience in developing an application. This was a good opportunity to experience developing in Node.js as it also seemed like a suitable choice for the software with plenty of guidance available.
